

he Simple Workflow:

1. **Open the Main Report in Crystal Reports Designer:**
 - Launch the Crystal Report that contains the subreport in SAP Crystal Reports Designer.
2. **Verify/Update Subreport's Database Location:**
 - **Right-click** on the subreport object within the main report's design canvas.
 - Select **Edit Subreport**. This will open the subreport in a new tab within Crystal Reports Designer.
 - Once in the subreport's design view, go to **Database > Set Data Source Location....**
 - Update the database connection for the subreport to point to the correct, current database (just as you would for a standalone report).
 - Close the "Set Data Source Location" window and save the subreport.
 - Close the subreport tab to return to the main report.
3. **Update Subreport Links:**
 - Back in the main report's design view, **right-click** on the subreport object again.
 - Select **Change Subreport Links....**
 - In the "Subreport Links" window:
 - **Review the fields** listed in the "Fields to link to" section.
 - Ensure that the fields selected from the main report (on the left) and the subreport (on the right) are still correct and match the data you intend to pass.
 - If you've changed field names or the linking logic, **add or remove fields accordingly** to establish the correct connection.
 - Click **"OK"** to save the link changes.
