

To restrict access to removing queries in SAP Business One, you need to manage user authorizations at the query group level. This involves setting permissions for users to prevent them from deleting queries within specific groups.

Here's a breakdown of the steps:

1. Navigate to General Authorizations:

- Go to Administration > System Initialization > Authorization > General Authorization.
-

2. Select the User:

- Choose the user or user group you want to restrict from deleting queries.
-

3. Locate the Subject:

- In the Subject column, navigate to Reports > Query Generator.
-

4. Set Authorization for Removing Queries:

- You can restrict access to the "Delete" button within the Query Manager. This may involve setting "No Authorization" for certain query groups or removing permissions for the user to modify or delete queries within those groups.
- Alternatively, you can restrict the query groups themselves, which will make the Delete button appear but prevent deletion attempts with an error message.
- To prevent users from even seeing the Delete button, you need to remove their access to the query groups.

Now, if user RF28 attempts to edit a query, RF28 will encounter the error message: "You have no authorization to edit this category."

 You have no authorization to edit this category
