# Question:

Question: When working with Crystal Reports for SAP Business One, particularly with customized reports linked to stored procedures, why do I receive the error "This field name is not known" after changing a parameter field?

SAP Crystal Reports   ✕

⚠ This field name is not known.

OK

Answer:

To resolve this, you need to manually update any formulas within the Crystal Report that reference the modified parameter.

1. Open the Report in Crystal Reports Designer:

   Launch the problematic Crystal Report in SAP Crystal Reports Designer.

   Access the Field Explorer:

2. On the left-hand side, open the "Field Explorer" pane.

   Locate the Parameter Field:

   Navigate to the "Parameter Fields" section.

   Right-click on the parameter field that corresponds to the one you recently changed in your stored procedure.

3. Find in Formulas:

   From the **right-click context menu, select "Find In Formulas..."**.

This action will open the "Formula Workshop" and highlight all formulas that reference this specific parameter.

4. Correct the Formulas:

In each identified formula, update the parameter name to match its new, correct name as defined in your stored procedure.

5. Save each formula after correction.
